Calculus (from Latin calculus, literally 'small pebble', used for counting and calculations, as on an abacus) is the mathematical study of continuous change, in the same way that geometry is the study of shape and algebra is the study of generalizations of arithmetic operations.. It has two major branches, differential calculus (concerning instantaneous rates of change and slopes of curves ...

Let us do 1 more example here, we want to find the arc length of $y = \ln(x)/2 - x^2/4$. So we do not integrate the function directly, we look at its derivative. f' is, well, the derivative of $\ln(x)$ is $1/x$ so this is $1/2x$ - the derivative of x^2 is $2x$. So the 2 and 4 cancel, so we get $x/2$. So then we are going to find $f'(x)$ so that is a 2, so $1/4x^2$.

In computer science, Coq is an interactive theorem prover. It allows the expression of mathematical assertions, mechanically checks proofs of these assertions, helps to find formal proofs, and extracts a certified program from the constructive proof of its formal specification. Coq works within the theory of the calculus of inductive constructions, a derivative of the calculus of constructions.

A convenient mnemonic for remembering the definition of the sine, as well as the cosine and tangent, is SOHCAHTOA (sine equals opposite over hypotenuse, cosine equals adjacent over hypotenuse, tangent equals opposite over adjacent).. As a result of its definition, the sine function is periodic with period .
