We use the term mass as a quantitative measure of inertia, and we may measure mass, for example, by swinging an object in a circle at a certain speed and measuring how much force we need to keep it in the circle. In this way we find a certain quantity of mass for every object. Now the momentum of an object is a product of two parts: its mass and its velocity.

Kinematics is a branch of classical mechanics that describes the motion of points, bodies (objects), and systems of bodies (groups of objects) without considering the forces that caused the motion. Kinematics, as a field of study, is often referred to as the "geometry of motion" and is occasionally seen as a branch of mathematics.

In physics, a force is any interaction that, when unopposed, will change the motion of an object. A force can cause an object with mass to change its velocity (which includes to begin moving from a state of rest), i.e., to accelerate. Force can also be described intuitively as a push or a pull. A force has both magnitude and direction, making it a vector quantity.

Chapter 9 . VESTIBULAR SYSTEM. The vestibular apparatus is the nonauditory portion of the inner ear. It serves three primary purposes in man: (1) it plays the dominant role in the subjective sensation of motion and spatial orientation of the head, (2) it adjusts muscular activity and body position to maintain posture, and (3) it stabilizes in space the fixation point of the eyes when the head ...
