A complex number is a number that can be expressed in the form $a + bi$, where a and b are real numbers, and i is a solution of the equation $x^2 = -1$. Because no real number satisfies this equation, i is called an imaginary number. For the complex number $a + bi$, a is called the real part, and b is called the imaginary part. Despite the historical nomenclature "imaginary", complex numbers are ...

In elementary mathematics, a variable is a symbol, commonly a single letter, that represents a number, called the value of the variable, which is either arbitrary, not fully specified, or unknown. Making algebraic computations with variables as if they were explicit numbers allows one to solve a range of problems in a single computation. A typical example is the quadratic formula, which allows ...

Linear Programming Linear programming is often a favorite topic for both professors and students. The ability to introduce LP using a graphical approach, the relative ease of the solution method, the widespread availability of LP software packages, and the wide range of applications make LP accessible even to students with relatively weak mathematical backgrounds.

4.3.2 Estimators. Represent some observable phenomenon with a random variable X . The distribution of X is known except for the value of some parameter θ . We observe the phenomenon m times, compiling numerical data $\{x [1], x [2], \dots, x [m]\}$, which we treat as a realization of a sample $\{X [1], X [2], \dots, X [m]\}$. We wish to use the data to estimate the parameter θ of the distribution of X .
