Phase-contrast microscopy is an optical microscopy technique that converts phase shifts in light passing through a transparent specimen to brightness changes in the image. Phase shifts themselves are invisible, but become visible when shown as brightness variations. When light waves travel through a medium other than vacuum, interaction with the medium causes the wave amplitude and phase to ...

The Raman effect was first reported by Sir C.V. Raman in 1928 (Raman, 1928, Raman and Krishnan, 1928, Raman and Krishnan, 1929) and is the inelastic scattering of light. Incident photons lose or gain energy by interaction with the sample, the loss of incident photon energy is a much stronger effect and is termed Stokes scattering - the reverse process, in which the incident photons gain ...

Visible light can be used to examine *C. elegans*, however, in general, bright field and phase-contrast microscopy offers little contrast- making cells and their major components difficult to see. DIC microscopy, however, allows high contrast images to be formed, and is ideal for examining nuclei, nucleoli, and granular structures within *C. elegans* cells (Sulston and Horvitz, 1977; Sulston et al ...

Smart textiles based on actuator materials are of practical interest, but few types have been commercially exploited. The challenge for researchers has been to bring the concept out of the laboratory by working out how to build these smart materials on an industrial scale and permanently incorporate them into textiles.
